

SaaS Subscription Lifecycle and Plan Management

Overview

This support document details the operational policies and instructions for subscription lifecycle operations within the Adsparkx platform. This includes processing workspace upgrades, downgrading user tiers, handling cancellations, editing active billing cycle intervals, checking renewal schedules, and managing enterprise migrations. Workspace members with Owner or Billing Administrator roles can execute lifecycle modifications directly from the account settings panel. The platform supports monthly and annual subscription intervals, each with specific proration adjustments. The billing system matches active configurations dynamically, ensuring modifications are reflected immediately on feature permissions and usage scopes.

Symptoms

Subscription lifecycle changes can occasionally produce unexpected system symptoms. Common indications include: observing a 'Plan Downgrade Pending' warning banner in the dashboard; having user seats disabled or revoked immediately after moving to a lower tier; seeing prorated credit adjustments on the monthly invoice following a mid-cycle seat upgrade; receiving warning notifications from the API Gateway indicating token usage is restricted due to a pending plan cancellation; or noting that billing features are locked after a failed payment, even if a new card was registered. In rare cases, active database connection permissions may drop if the tier threshold is exceeded.

Common Causes

Subscription adjustment anomalies typically originate from a few administrative causes. A downgrade request failing to apply immediately is usually by design, as standard downgrades are held in a pending state until the current billing period ends. Prorated invoice adjustments are caused by adding or removing team seats mid-month, triggering calculations that charge for the active days. Reactivation issues can happen if a workspace has outstanding invoices that must be paid before the account features can be unlocked. Database propagation delay between Stripe Webhooks and the Gateway can also cause a temporary lag in permission updates.

Troubleshooting Steps

To troubleshoot issues related to subscription upgrades, downgrades, or cancellations, follow these steps: 1. Confirm User Role: Ensure your user account is assigned the Workspace Owner or Billing Admin role. Members cannot initiate plan tier changes. 2. Check Plan Status: Navigate to Settings > Billing and check your active tier name and billing cycle dates. 3. Review Seat Usage: When downgrading, ensure your active seat count does not exceed the maximum allowed limits of the target lower plan. Clean up inactive user slots first. 4. Inbound Invoice Check: Check if your account has any unpaid bills in the invoice history panel. 5. Force Token Sync: If permissions are not updated after payment, log out and log back in to clear cache.

Resolution

Subscription adjustments can be resolved with the following actions: Upgrades are processed instantly. When upgrading mid-cycle, the system immediately unlocks the new tier features, and calculates a prorated charge which is either billed immediately or added to the next invoice. Cancellations stop the renewal cycle. When a workspace cancellation is requested, your plan remains active until the current billing cycle expires, allowing you full access to features you have already paid for. For reactivations, resolving any outstanding invoice balances in the billing panel will instantly reactivate the workspace and restore full API connection throughput.

Best Practices

Maximize the value of your subscription by adhering to these guidelines: Plan downgrades or cancellations should be requested at least 3 business days before the next renewal date to prevent automated renewal charges. For large teams, consider moving from individual seat licensing to the Enterprise tier to centralize billing and request custom contracts. Keep backup payment methods registered on your account to avoid automatic workspace suspensions if a primary card transaction fails. Run test configurations in a dedicated sandbox account before purchasing additional production capacities.

Frequently Asked Questions

Q: Can I change my billing cycle from monthly to annual? A: Yes. Navigate to Settings > Billing, locate the billing cycle settings, and select Annual. This change applies immediately, and the system will credit any unused days of your current month toward the annual total. Q: What happens to my data if I cancel my subscription? A: After cancellation, your workspace remains in a read-only state for 90 days. During this window, you can reactivate your subscription to restore full access. After 90 days, inactive workspace data is deleted.

Q: How do I migrate my team to an Enterprise plan? A: Enterprise migrations require provisioning by our account team. Go to the pricing page, click 'Contact Enterprise Sales', and our team will prepare a custom contract. Q: Can I merge two separate subscriptions into a single account? A: Subscription merging requires database migration. Contact support to have our integration engineers merge your data and consolidate invoices.

Escalation Conditions

Subscription lifecycle tickets should be escalated to a human account specialist under these conditions: 1. Active plan upgrades that do not unlock features within 30 minutes of payment. 2. Custom contract adjustments or billing cycle overrides requested by Enterprise tier customers. 3. Inability to access the billing dashboard to initiate a subscription cancellation. 4. Reactivation failures on accounts where outstanding invoices have been paid in full. 5. Requests for workspace data migration or subscription consolidation. The escalation handoff must list the workspace ID, the target plan tier, the payment transaction ID, and the nature of the upgrade/cancellation request.

Additional Notes

Workspace members with 'Member' or 'Viewer' permissions are restricted from viewing billing details or initiating plan changes. If the billing buttons do not appear in settings, contact your workspace owner to check your role permissions. All metadata associated with deactivated accounts is retained for a maximum of 120 days under our standard data recovery policy.
